

CLAIMS

1. A device for assisting an archer in shooting an arrow from a bow while aiming the arrow at a target, the device comprising:
 - a vertical slide;
 - 5 a vertical slide mount slidably engaged with the vertical slide to allow movement of the vertical slide in a vertical direction;
 - a horizontal bar adapted for receiving an aiming sight and engaged with at least one of the vertical slide and vertical slide mount to allow movement of the horizontal bar in a horizontal direction; and
 - 10 a removable adjustment member that adjusts the aiming sight in controlled, finite, repeatable, increments in the horizontal and vertical direction relative to a fixed point on a bow.
2. The device of claim 1, further including a mounting member mounted to
15 the bow and engaged to the vertical slide mount.
3. The device of claim 2, further including an extension member extending between the mounting member and the vertical slide mount.
- 20 4. The device of claim 1 further including a first coupling to couple the adjustment member to the horizontal bar and at least one of the vertical slide and vertical slide mount.
- 25 5. The device of claim 1 further including a second coupling to couple the adjustment member to vertical slide and the vertical slide mount.
6. A device for assisting an archer in shooting an arrow from a bow while aiming the arrow at a target, the device comprising:
 - a horizontal bar adapted for receiving an aiming sight;
 - 30 a vertical slide slidably engaged with the horizontal bar to allow movement of the horizontal bar in a horizontal direction;

a vertical slide mount slidably engaged with the vertical slide to allow movement of the vertical slide in a vertical direction; and

5 a removable adjustment member that adjusts the aiming sight in controlled, finite, repeatable, increments in the horizontal and vertical direction relative to a fixed point on a bow, wherein the adjustment member includes a first coupling to couple the adjustment member to the horizontal bar and at least one of the vertical slide and vertical slide mount.

10 7. The device of claim 6, further including a mounting member mounted to the bow and engaged to the vertical slide mount.

8. The device of claim 7, further including an extension member extending between the mounting member and the vertical slide mount.

15 9. The device of claim 6 further including a first coupling to couple the adjustment member to the horizontal bar and at least one of the vertical slide and vertical slide mount.

20 10. The device of claim 6 further including a second coupling to couple the adjustment member to vertical slide and the vertical slide mount.

25 11. A device for assisting an archer in shooting an arrow from a bow while aiming the arrow at a target, the device comprising:
a horizontal bar adapted for receiving an aiming sight;
a vertical slide slidably engaged with the horizontal bar to allow movement of the horizontal bar in a horizontal direction;
a vertical slide mount slidably engaged with the vertical slide to allow movement of the vertical slide in a vertical direction; and
30 a removable adjustment member that adjusts the aiming sight in controlled, finite, repeatable, increments in the horizontal and vertical direction relative to a fixed point on a bow, wherein the adjustment member includes a first coupling to couple the adjustment member to the horizontal bar and at least one of the vertical slide and vertical slide mount,

and a second coupling to couple the adjustment member to vertical slide and the vertical slide mount.

5 12. The device of claim 11, further including a mounting member mounted to the bow and engaged to the vertical slide mount.

 13. The device of claim 12, further including an extension member extending between the mounting member and the vertical slide mount.

10 14. The device of claim 11 further including a first coupling to couple the adjustment member to the horizontal bar and at least one of the vertical slide and vertical slide mount.
